

Instruções do exercício

For the final project of the course, students must work individually or in groups of up to 2 students and develop a practical application using LLM-based agent systems.

The application must solve, simulate, or support a real problem of your choice. The topic is open: education, health, finance, productivity, research, customer service, software development, data analysis, or any other relevant domain.

Objective

The objective is to apply the concepts learned during the course to create a functional prototype or conceptual demonstration using LangGraph, LangChain, Deepagents, tools, and SKILLS.

Your solution must include:

- One LangGraph workflow with at least 3 nodes
- At least one router or conditional edge
- Multiple tools
- At least one DeepAgent
- At least one SKILL used by the Deepagent
- A clear connection to a real problem

You are free to design the architecture and choose the application. Creativity is encouraged.

Submission

There is no code submission.

The project will be evaluated through an oral presentation of 5 to 10 minutes during the final class, supported by slides.

The presentation must include:

- The real problem you chose
- The proposed solution
- How the workflow was structured, describing which and how tools, router, Deepagent, and SKILLS were used
- A demonstration of the system running, either real or simulated
- Main challenges, decisions, and lessons learned

Evaluation Criteria

The evaluation will consider:

- Relevance and complexity of the problem
- Creativity and originality of the solution
- Correct use of LangGraph concepts, including nodes, tools, and router
- Use of Deepagent and SKILLS
- Quality of the demonstration
- Clarity and organization of the presentation
- Ability to share useful insights with the class

The goal is not to deliver perfect software, but to show a thoughtful and working use of agent systems to address a real problem.
